

Suction Hand Cups

Manually Operated Suction Hand Cups

ANVER Hand Vacuum Cups and Suction Cups can save time and eliminate cut fingers when lifting and handling unwieldy items.

Powerful and reliable, they will firmly hold on to most smooth, dry, nonporous surfaces making them ideal for handling difficult or bulky loads.

They allow you to attach a handle where you want one, thus reducing back-aches, strains and cut fingers. Whether you are handling glass, polished stone, fiberglass or sheet metal, these hand suction cups are an inexpensive way to let you work better and more efficiently.

As professionals know, the right tool can make all the difference.

- The principle of operation is by lever or pump action. The round suction cups are pressed onto the surface of the object to be lifted. The lever grip is squeezed together or the cam levers are flipped into position. The rubber pads are then securely clamped to the surface by vacuum. To release, just flip back the levers.

- Loads need to be smooth, relatively flat and non-porous. Surfaces should be free of oil, grease or water, otherwise slipping can occur. Nonporous materials such as glass, metal, Formica, plastics, fiberglass, linoleum and polished stone are good examples. The grip these suction cups obtain on a load surface is amazingly strong and has to be experienced to be appreciated. Semi-porous materials require using our air-powered hand vacuum cups.
- ANVER suction hand cups are of the highest quality for reliability and safety. They display thoughtful design and attention to detail. Just look at the lever mechanisms or overall design, and you will see that ANVER suction hand cups are light, strong, and well finished. They have the feel of a well balanced tool and are much easier to use than older makes. Since their introduction, ANVER hand vacuum cups have become acknowledged as the finest available and the new standard in value.

ANVER Item No.	Carrying Capacity at a 4 to 1 Safety Factor	Description
